Signoffs and Grade:

Name:_____

Component	Signoff	Date	Time
Hex Display Counts Up -Stops at 9			
Hex Display Counts down -Stops at 0			
Bonus Points: Counter Wraps Around in both directions (+5pts)			

==========

Component	Received	Possible
Prelab		10
Signoffs		90
Penalties • 1st week after session lab is due : -10 • 2nd week after session lab is due: -25 No signoffs will be given more than 2 weeks after due date	-	
Total		100

Education Objective

The educational objective of this laboratory is to investigate the use of the NIOS II assembly language to interface the NIOS II processor with I/O devices on the DE1-SoC development board.

Technical Objective

The technical objective of this laboratory is to design an embedded system for the Nios II processor and DE1-SoC that will execute an assembly language programs that increments and decrements a single digit counter displayed on the seven-segment display when the pushbutton KEY1 is pressed.

Prelab

Complete prelab parts 1 and 2. When the prelab is complete, you should have a system that sets HEX0 to a zero when the assembly program is run.

Prelab Part 1 - Hardware

1. Open Quartus II and create a new project
2. Open tools > Platform Designer
3. Create a system with the following components
    a. Nios II/e processor
    b. On-chip memory for program code and data
    c. 8-bit input PIO for switches
    d. 4-bit input PIO for pushbuttons
    e. 7-bit output PIO for hex0
    f. JTAG Uart
    g. Sysid

   You can use lab 1 as a guide, but it is important to be able to create the nios_system on your own, so that building the system does not become a stumbling block on future labs and demos.
4. Save your system as nios_system.qsys
5. Generate the VHDL
6. Return to the Quartus project and add nios_system.qip to the project
7. Create the top_level VHDL file. The <project>/nios_system/nios_sytem_inst.vhd file contains the component declaration and the port map template to instantiate nios_system.
8. Use Assignments > Import Assignments… to import the pin assignments in the DE1_SoC.qsf file
9. Compile the design
10. Program the DE1_SoC board.

Part 2 – Software

1. Write a NIOS II assembly language program that does the following:
    a. Displays 0 on hex0
2. **Obtain a prelab signoff**

Procedure

Part1 - Software

1. Write a NIOS II assembly language program that does the following:
    a. Displays 0 on hex0
    b. Checks to see if key1 is pushed (active low)
        i. If SW0 is high, increments the value on hex0
        ii. If SW0 is low, decrements the value on hex0
    c. Do not increment or decrement the value on hex0 until key1 is released
    d. Do not go higher than 9, or lower than 0.
2. Below are some suggestions for writing the code
    a. Use bit masking (learned in microcontrollers) to isolate bits
    b. Use a subroutine for displaying the current count and for waiting for the key to be released
    c. Use an array (example in the lecture notes) for storing the seven-segment display constants
3. BONUS: Once you have all of your signoffs, you may expand on the original assembly design and create a wraparound counter that allows the user to increment from 9 -> 0, and decrement from 0 -> 9.
4. **Obtain signoffs from the professor or TA**
